

## Part VI:

# Summary of the risk management plan for Bevifol

This is a summary of the risk management plan (RMP) for Bevifol. The RMP details important risks of Bevifol, how these risks can be minimised, and how more information will be obtained about Bevifol's risks and uncertainties (missing information).

Bevifol's summary of product characteristics (SmPC) and its package leaflet give essential information to healthcare professionals and patients on how Bevifol should be used.

## I. The medicine and what it is used for

Bevifol is authorised for prevention of symptomatic vitamin B<sub>6</sub>, vitamin B<sub>12</sub> and folic acid deficiency (see SmPC for the full indication).

It contains folic acid, cyanocobalamin (vitamin B<sub>12</sub>) and pyridoxine hydrochloride (vitamin B<sub>6</sub>) as the active substances and it is administered orally as tablets.

## II. Risks associated with the medicine and activities to minimise or further characterise the risks

Important risks of Bevifol, together with measures to minimise such risks and the proposed studies for learning more about Bevifol's risks, are outlined below.

Measures to minimise the risks identified for medicinal products can be:

- Specific information, such as warnings, precautions, and advice on correct use, in the package leaflet and SmPC addressed to patients and healthcare professionals;
- Important advice on the medicine's packaging;
- The authorised pack size — the amount of medicine in a pack is chosen so to ensure that the medicine is used correctly;
- The medicine's legal status — the way a medicine is supplied to the patient (e.g. with or without prescription) can help to minimise its risks.

Together, these measures constitute *routine risk minimisation* measures.

In addition to these measures, information about adverse reactions is collected continuously and regularly analysed so that immediate action can be taken as necessary. These measures constitute *routine pharmacovigilance activities*.

### II.A List of important risks and missing information

Important risks of Bevifol are risks that need special risk management activities to further investigate or minimise the risk, so that the medicinal product can be safely taken. Important risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient proof of a link with the use of Bevifol. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation. Missing information refers to information on the safety of the medicinal

product that is currently missing and needs to be collected (e.g. on the long-term use of the medicine);

<b>List of important risks and missing information</b>	
Important identified risks	None
Important potential risks	None
Missing information	None

### ***II.B Summary of important risks***

Not applicable.

### ***II.C Post-authorisation development plan***

#### **II.C.1 Studies which are conditions of the marketing authorisation**

There are no studies which are conditions of the marketing authorisation or specific obligation of Bevifol.

#### **II.C.2 Other studies in post-authorisation development plan**

There are no studies required for Bevifol.
