To our customers of

Infinity Acute Care System Workstation Critical Care – Evita Infinity V500

Infinity Acute Care System Workstation Neonatal Care – Babylog VN500

Evita V300

Availability of SW 2.51   July 2017

Dear Madam/Sir,

We recently informed you about the market introduction of SW 2.50 for the above mentioned devices. SW 2.50 supports a newly developed power supply module (M7.3+) and introduced a new battery concept together with the possibility of determining the operating time of the installed batteries.

We would like to inform you about further improvements which will be rolled out to all devices containing SW 2.50 and an M7.3+.

The following changes will be introduced with the installation of SW 2.51:

- Change of wording for SW and Instruction for Use (US-English only)
- Configurable battery check
    - Battery check and associated functions can be activated/deactivated
        - For further information please refer to the respective Instruction for use.
- Correction of requesting a battery check although valid battery check data are available
- Introduction of new firmware for M7.3+
    - Improvement of displayed charge status after storage of devices with partially discharged batteries

We apologize for any inconvenience the implementation of this improvement may cause for you and your organisation and thank you for your support.

Please contact your local DrägerService representative to obtain more information about this software release and to schedule installation.

Best regards,

Frank Ralfs
