

## **Part VI: Summary of the risk management plan**

### ***Summary of risk management plan for Semfine®***

This is a summary of the risk management plan (RMP) for Semfine®. The RMP details important risks of Semfine®, how these risks can be minimised, and how more information will be obtained about Semfine®'s risks and uncertainties (missing information).

Semfine®'s summary of product characteristics (SmPC) and its package leaflet give essential information to healthcare professionals and patients on how Semfine® should be used.

#### ***I. The medicine and what it is used for***

Semfine® is authorised for the treatment of as single disease modifying therapy in highly active relapsing remitting multiple sclerosis of adult and paediatric patients aged 10 years and older (see SmPC for the full indication). It contains fingolimod as the active substance and it is given orally.

#### ***II. Risks associated with the medicine and activities to minimise or further characterise the risks***

Important risks of Semfine®, together with measures to minimise such risks and the proposed studies for learning more about Semfine®'s risks, are outlined below.

Measures to minimise the risks identified for medicinal products can be:

- Specific information, such as warnings, precautions, and advice on correct use, in the package leaflet and SmPC addressed to patients and healthcare professionals;
- Important advice on the medicine's packaging;
- The authorised pack size - the amount of medicine in a pack is chosen so to ensure that the medicine is used correctly;
- The medicine's legal status - the way a medicine is supplied to the patient (e.g. with or without prescription) can help to minimise its risks.

Together, these measures constitute routine risk minimisation measures.

In the case of Semfine®, these measures are supplemented with additional risk minimisation measures mentioned under relevant important risks, below.

In addition to these measures, information about adverse reactions is collected continuously and regularly analysed so that immediate action can be taken as necessary. Special attention is given to a number of adverse events. These measures constitute routine pharmacovigilance activities.

If important information that may affect the safe use of Semfine® is not yet available, it is listed under «missing information» below.

#### ***II.A List of important risks and missing information***

Important risks of Semfine® are risks that need special risk management activities to further investigate or minimise the risk, so that the medicinal product can be safely taken. Important risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient proof of a link with the use of Semfine®. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation.

Missing information refers to information on the safety of the medicinal product that is currently missing and needs to be collected (e.g. on the long-term use of the medicine);
