
EU Risk Management Plan

Part VI: Summary of the risk management plan

Summary of risk management plan for Noradrenaline (Norepinephrine) Kabi

This is a summary of the RMP for Noradrenaline (Norepinephrine). The RMP details important risks of Noradrenaline how these risks can be minimised, and how more information will be obtained about Noradrenaline risks and uncertainties (missing information).

Noradrenaline SmPC and its PL give essential information to healthcare professionals and patients on how Noradrenaline should be used.

Important new safety concerns will be included in updates of the Noradrenaline RMP.

I. The medicine and what it is used for

Noradrenaline is authorised –

- in adults for use as an emergency measure in the restoration of blood pressure in cases of acute hypotension

It contains noradrenaline tartrate as active substance and is administered by intravenous route.

II. Risks associated with the medicine and activities to minimise or further characterise the risks

Measures to minimise the risks identified for medicinal products can be:

- Specific information, such as warnings, precautions, and advice on correct use, in the PL and SmPC addressed to patients and healthcare professionals;
- Important advice on the medicine's packaging;
- The authorised pack size — the amount of medicine in a pack is chosen so to ensure that the medicine is used correctly;
- The medicine's legal status — the way a medicine is supplied to the patient (e.g. with or without prescription) can help to minimise its risks.

Together, these measures constitute *routine risk minimisation* measures.

In addition to these measures, information about adverse reactions is collected continuously and regularly analysed, including PSUR assessment so that immediate action can be taken as necessary. These measures constitute *routine pharmacovigilance activities*.

II.A List of important risks and missing information

Important risks of Noradrenaline are risks that need special risk management activities to further investigate or minimise the risk, so that the medicinal product can be safely administered. Important

EU Risk Management Plan

risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient proof of a link with the use of Noradrenaline. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation. Missing information refers to information on the safety of the medicinal product that is currently missing and needs to be collected (e.g. on the long-term use of the medicine).

List of important risks and missing information	
Important identified risks	None
Important potential risks	None
Missing information	None

II.B Summary of important risks

Not applicable

II.C Post-authorisation development plan

II.C.1 Studies which are conditions of the marketing authorisation

There are no studies which are conditions of the marketing authorisation or specific obligation of Noradrenaline.

II.C.2 Other studies in post-authorisation development plan

There are no on-going or closed studies for Noradrenaline.
